2015 ANNUAL DRINKING WATER QUALITY REPORT PWSID # 5320042 - PINE TWP - INDIANA COUNTY MUNICIPAL SERVICES AUTHORITY

Este informe contiene información importante acerca de su agua potable. Haga que alguien lo traduzca para usted, ó hable con alguien que lo entienda. (This report contains important information about your drinking water. Have someone translate it for you, or speak with someone who understands it.)

WATER SYSTEM INFORMATION:

This report shows our water quality and what it means. If you have any questions about this report or concerning your water utility, please contact **Mike Duffalo**, **Executive Director at 724-349-6640 ext 102**. We want you to be informed about your water supply. If you want to learn more, please attend any of our regular meetings held on the **2**nd **Tuesday of each month at 7:30 pm, ICMSA Office**, **602 Kolter Drive**, **Indiana, Pa. 15701.** This report is posted on line at: www.icomsa.org Paper copies will be mailed upon request by calling the ICMSA office (724)349-6640..

SOURCE(S) OF WATER:

The Heilwood Mine Pool is the main source of water for the Pine Township water system. It had a common name of "Stush's Spring" when it was brought in as a new water source a number of years ago. The source has a daily flow of 1.2 million gallons per day. Pumping capacity is 144,000 gallons per day (GPD) and average use on the system for 2014 was 80,000 GPD. The Heilwood Mine Pool is a ground water source with a discharge south of the Village of Heilwood. It enters a wet well and is pumped back to the Heilwood Water Treatment Plant before it is pumped again to the distribution system.

SOURCE WATER ASSESSMENT:

A Source Water Assessment of most public water source(s) is completed by the Pa. Dept. of Environmental Protection (Pa, DEP). The Assessment typically list the types of contamination for which the source water might be exposed to. An Assessment has not been published for the Heilwood Mine Pool and Well #2. As groundwater sources, the Heilwood Mine Pool and Well #2 have a moderate risk of contamination from gas well drilling and coal mining activities. Monitoring these activities is an important part of source water protection. ICMSA is working with the PA Rural Water Association to develop a Well Head Protection program for the Heilwood Mine Pool and Well #2.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the *Safe Drinking Water Hotline* (800-426-4791).

MONITORING YOUR WATER:

We routinely monitor for contaminants in your drinking water according to federal and state laws. The following tables show the results of our monitoring for the period of January 1 to December 31, 2015. The State allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data is from prior years in accordance with the Safe Drinking Water Act. The date has been noted on the sampling results table.

DEFINITIONS:

Action Level (AL) - The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Minimum Residual Disinfectant Level (MinRDL) - The minimum level of residual disinfectant required at the entry point to the distribution system.

Treatment Technique (TT) - A required process intended to reduce the level of a contaminant in drinking water.

Mrem/year = millirems per year (a measure of radiation absorbed by the body)

adiation absorbed by the body)

pCi/L = picocuries per liter (a measure of radioactivity)

ppb = parts per billion, or micrograms per liter (μ g/L)

ppm = parts per million, or milligrams per liter

(mg/L)

ppq = parts per quadrillion, or picograms per

liter

ppt = parts per trillion, or nanograms per liter

DETECTED SAMPLE RESULTS: ND means Not Detected and NR means Not Required

Contaminant	emical Contaminants MCL in CCR ntaminant Units MCLG		Level Detected	Range of Detections	Units	Sample Date	Violation Y/N	Sources of Contamination		
Chlorine	MRDL 4	MRDL 4	2.0	1.0 to 2.0	ppm	Aug 2015	N	Additive used to Control microbes		
Barium	2	2	.028	One Sample	ppm	2015	N	Discharge from Drilling Waste		
, Flouride	2	2	.232	.232 to .232	ppm	2015	N	Additive promotes strong teeth. Discharge from factories.		
HAA5	60	N/A	0	One Sample	ppb	5-29-15	N	Chlorination by product		
TTHM	80	N/A	0	One Sample	ppb	5-29-15	N	Chlorination by product		

Note: Our last tests for Uranium 226 and 228 were in 2012 with no detection levels.

Entry Point Disinfectant Residual								
Confaminant	Minimum Disinfectant Residual	Lowest Level Detected	Range of Detections	Units	Sample Date	Violation Y/N	Sources of Contamination	
Chorine	0.2	.6	.6 to 2.7	ppm	09/19/15	N	Water additive used to control microbes.	

Lead and Co Contaminant	Action	MCLG	90 th Percentile Value	Units		Violation Y/N	Sources of Contamination
Lead (2013)	15	0	0	ppb	0 of 10	N	Corrosion of household plumbing.
Copper (2013)	1.3	1.3	.663	ppm	0 of 10	Z	Corrosion of household plumbing.

Note: Next series of tests will be in 2016.

Microbial							
Contaminants	MCL	MCLG	Highest # or % of Positive Samples	Violation Y/N	Sources of Contamination		
Total Coliform Bacteria	For systems that collect <40 samples/month: • More than 1 positive monthly sample	0	0	N	Naturally present in the environment.		
	For systems that collect ≥ 40 samples/month: • 5% of monthly samples are positive						

HEALTH EFFECTS:

ICMSA is glad to report to you the consumer that your drinking water met all the health and water quality requirements of the Safe Drinking Act for 2015 except as noted in this report. We also met all the monitoring and notification requirements for 2015 except as noted in this report.

More detail on all health effects can be received by calling the EPA Hotline (800-426-4791).

EDUCATIONAL INFORMATION:

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban stormwater run-off, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA and DEP prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA and DEP regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's *Safe Drinking Water Hotline* (800-426-4791).

Information about Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Indiana County Municipal Services Authority (ICMSA) is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

OTHER INFORMATION:

If you have any questions, regarding this report or your drinking water, please do not hesitate to call during business hours (8am to 4pm) 724-349-6640. Our phone is a 24/7 number and can be used to report any water emergency after 4pm. To keep customers updated and informed, we have developed a new **WEB SITE** @ www.icomsa.org Please visit our site to learn more.

For your information, between May of 2016 and May of 2017, ICMSA will be doing a line extension titled the "Penn Run Extension". As a part of that project, we will be replacing the filters at the water plant. The plant renovations are being done to ensure compliance with the Safe Drinking Water Act.

OTHER VIOLATIONS:

On 12-04-2015 we mailed each customer a Tier 2 Public Notice that on certain dates in September and October our entry point Chlorine dropped below .8 mg/l. This was a violation of the Ground Water Rule to provide adequate treatment. In addition, we had one monitoring violation which can be found on the attached Tier 3 Notice – "Failure to Monitor".

IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER FAILURE TO MONITOR

ESTE INFORME CONTIENE INFORMACIÓN IMPORTANTE ACERCA DE SU AGUA POTABLE. HAGA QUE ALGUIEN LO TRADUZCA PARA USTED, O HABLE CON ALGUIEN QUE LO ENTIENDA.

Monitoring Requirements Not Met for TTHM & HAA5 for Pine Twp. System, PWS 5320042

Our water system violated several drinking water standards over the past year. Even though these were not emergencies, as our customers, you have a right to know what happened and what we did to correct these situations.

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During May 2015 we took our samples late on May 29th when they were scheduled between May 16th and May 22nd and therefore cannot be sure of the quality of our drinking water during that time.

What should I do?

There is nothing you need to do at this time.

The table below lists the contaminant(s) we did not properly test for during the last year, how often we are supposed to sample for TTHMs & HAA5s and how many samples we are supposed to take, how many samples we took, when samples should have been taken, and the date on which follow-up samples were (or will be) taken.

Contaminant	Required sampling frequency	Number of samples taken	When all samples should have been taken	When samples were or will be taken		
TTHMs	Annual	One	May 16 th to May 22nd	May 29th		
HAA5s	Annual	One	May 16th to May 22nd	May 29th
